4 次の英文を読んで後の問いに答えなさい。

Why is water so important for life?

When you're hot and sweaty, nothing tastes better than a cold glass of water. Part of the reason it tastes so good is that your body is glad to have it. Exercise and hot weather can make you dehydrated. It's important to drink plenty of water every day, but you should drink it even more when it's hot out.

The human body needs a lot of water—almost two-thirds of your body mass is made up of water. This water doesn't just sit there, though. Your body uses it to keep you alive. In fact, all life on Earth depends on liquid water.

Water is a powerful chemical. It can break down the molecules of many other chemicals. Water is used in many of the chemical reactions which keep organisms alive. For example, plants need water for photosynthesis. Water mixes with carbon dioxide and sunlight to cause a chemical reaction. This process is how plants make their food.

Animals don't need water for nourishment, but they use water to help digest the food inside their bodies. Food contains sugars and fats that are made of large, complex molecules. The chemicals your body needs are hidden inside those sugar and fat molecules. Water breaks down the big molecules into simpler ones that your body can use.

Water also removes waste products from your body. When you go to the bathroom, water gets rid of the chemicals that your body doesn't need. If you don't have enough water, these waste chemicals can build up inside your body and make you sick.

Sweating and going to the bathroom cause you to lose water. You even lose water just by breathing. Exhale onto a mirror, and you can see the water in your breath condense on the glass. You must replace the water your body loses as it works through the day.

The amount of water you need changes from day to day. If it's hot outside and you're playing a lot, you should drink a lot of water. On a lazy Saturday in the middle of winter, however, you might not need as much. On average, you should have about six cups of liquid each day. Some of this liquid can come in the form of food, milk, and juices.
