2 Writing

Write Your Essay below:

Trees give to life and benefit all living things. Trees are some the largest, most beautiful and most well-known plants to humans. We see them every day in our neighborhoods, along the streets, in city parks and on mountains we go hiking on. There are several reasons why trees benefit living things on earth but I will write about how they provide oxygen, make homes for living creatures and how trees conserve soil.

To begin, trees provide oxygen. Trees breathe in carbon dioxide and breathe out oxygen. There is a lot of carbon dioxide in the air around us, especially in large cities because of car exhaust and factories. Plants, especially large ones such as trees, help us process this extra carbon dioxide and to replace it with the oxygen we need to breathe and live.

Next, trees provide homes for other living creatures. A wide range of living creatures use trees for their homes. Many birds make their nests in trees, and mammals, such as racoons or squirrels make take shelter there. Of course, many trees are also home to other plants, such as vines or orchids that live in tropical trees. Some of the creatures that live in trees are even too small to see; for example, many insects live in trees.

Lastly, trees conserve soil. The wind blows away a lot of the top layer of soil. The is top layer is especially rich and good soil that we don't want to lose. Because of the thick network of roots that trees have, they help hold the soil in place so it isn't blown away or washed away by heavy rains.

As you can see, trees provide all living things with several types of resources which can positively benefit living creatures.
